Personal AI agents

Small, runnable versions of the AI agents I use every day for my calendar, study, habits, goals and job search, with the safety rules that keep them from doing damage.

WHAT IT SHOWS

- A calendar agent that cannot write a bad plan: a plan that fails the checker goes back with the reasons; only a plan that passes, and that I approve, reaches the calendar.
- Flashcards meet the calendar: the review forecast of each deck becomes study blocks in the free slots of the week, through the same checker.
- Habits, goals and jobs from real formats: the habit app's export becomes a dashboard, goals are scored from the data, and public job openings are sorted into apply, monitor or discard.
- This repository is an excerpt with fictitious data; I run the full system on my own data.

HOW AI WAS USED

I use Claude (Claude Code and the API) for coding, review and documentation. The questions, modelling choices, validation and conclusions are mine.
